

In the Claims

1 1. (currently amended) A computer implemented method for typesetting a
2 set of glyphs represented as a set of graphical objects, comprising:
3 selecting a current glyph from the set of glyphs represented as a set of
4 graphical objects;
5 selecting a current position of the current glyph; and
6 determining a next position of a next glyph, the next glyph selected
7 from the set of glyphs, the selection continuing until a termination condition
8 is satisfied, the determining further comprising:
9 representing the current glyph as a two-dimensional distance
10 field;
11 determining the next position using the current position, an
12 escapement of the current glyph, and an alignment of the two-
13 dimensional distance field;
14 updating the current glyph to be the next glyph; and
15 updating the current position to be the next position.

1 2. (original) The method of claim 1 wherein the alignment aligns the two-
2 dimensional distance field to a pixel grid.

1 3. (original) The method of claim 1 wherein the alignment aligns the two-
2 dimensional distance field to a component of a pixel grid.

1 4. (original) The method of claim 1 wherein the alignment uses a selected
2 iso-contour of the distance field.

1 5. (currently amended) A computer implemented method for typesetting a
2 set of glyphs represented as a set of graphical objects, comprising:
3 selecting a current glyph from the set of glyphs represented as a set of
4 graphical objects;
5 selecting a current position of the current glyph; and
6 determining a next position of a next glyph, the next glyph selected
7 from the set of glyphs, the selection continuing until a termination condition
8 is satisfied, the determining further comprising:
9 representing the current glyph as a two-dimensional distance
10 field;
11 selecting an iso-contour of the two-dimensional distance field;
12 determining the next position using the current position, an
13 escapement of the current glyph, and the selected iso-contour;
14 updating the current glyph to be the next glyph; and
15 updating the current position to be the next position.

1 6. (original) The method of claim 5 wherein the selected iso-contour
2 determines an alignment of the two-dimensional distance field to a pixel
3 grid.

1 7. (original) The method of claim 5 wherein the selected iso-contour
2 determines an alignment of the two-dimensional distance field to a
3 component of a pixel grid.
